

PRE INJECTION PROTOCOL FOR DERMAL FILLER PATIENTS--

Dermal Fillers include Juvederm, Restylane, Perlane and Radiesse.

1. In an effort to help to minimize bruising, ten to fourteen days pre treatment, patients should stop taking any medications and/or herbal supplements that are blood thinning agents. This includes Aspirin, Baby Aspirin, Advil, Ibuprofen, Motrin, Bufferin, Anacin, Celebrex, Coumadin, higher doses of Vitamin C, Vitamin E and the higher doses of Omega 3's, St. John's Wort and Ginkgo.
2. If an analgesic is necessary, patients may take Tylenol and/or Extra Strength Tylenol.
3. Patients with a medical history of Herpes Simplex (cold sores) are at risk of outbreak with dermal filler treatment. To avoid this occurrence, patients must begin a pharmaceutical regime, beginning one day pre injection and continuing for the next six days. Please call our office if you think a prescription is needed.
